Where it came from Brenton Bailey (Brenton Bailey) Brenton Bailey (July 2, 1958 - May 9, 2011), who was born in the Bronx, New York, created his first computer-based drawing system in 1970 while at Columbia University. He teamed up with another classmate, Ed "Cactus" Auer (Ed Auer) to create and develop the first version of the MicroDraw CAD program (named MicroDraw), which was for the Apple II series of personal computers. As most of the hardware was not powerful enough, they decided to create a custom disk drive that could load their program into memory. Auer had a background in electronics and was able to design the custom circuit board that allowed it to read and write to a custom disk format. In 1974, Bailey and Auer applied for a patent for their disk drive that they called a Removable Storage Device. The patent was published in May 1976. In December 1975, an attorney working for Apple wrote to the duo about the possibility of creating a disk drive for the Apple II personal computer. The attorney did not receive a response to their letter, so they started using the Removable Storage Device to create a simple drafting program for the Apple II. This program was named SketchPad. The Removable Storage Device (RSD) was originally a form of audio cassette tape. It was driven by a 10-position rotary switch. The tape used was called J-tape, which was developed by Bell & Howell (now 3M) and shipped in metal cases. It used a specially-designed cartridge that had no tension across the tape. When the cartridge was placed in the tape drive, the magnetic flux of the tape acted like a spring, forcing the tape against the drive heads, providing the high storage density that a cassette tape of the time needed. During 1975, the Apple II was released. Sales of the Apple II were sluggish, so Apple decided to wait to sell the software with the computer. SketchPad was sold for US\$80 by a group of five professors. Because of the slow sales of the Apple II, Apple thought of selling the SketchPad program on its own. To do this, Apple needed a disk drive to store the software. In January 1976, Apple bought the rights to the RSD and attempted to market the disk drive as the "Apple RSD Cartridge", which was aimed at schools and businesses. It was

The effect of foraging site on foraging decisions in a foraging system. Food-web structure impacts the structure of ecological interactions at different hierarchical levels, but the relative importance of this effect varies with the scale of analysis. In this paper, we investigate the impact of food-web structure on foraging decisions at the individual level, in a system where each individual forages in both a food-rich and a food-poor patch. We compare the foraging decisions of individuals in a food-rich patch to those of individuals in a food-poor patch and find that the number of visits to food-rich patches decreases with increasing food-poor patch density. We find this effect to be consistent for all foraging individuals in our system, regardless of species or size, and we demonstrate how the effect can be intuitively explained by an individual's expected food intake from a food-poor patch. Thus, even though foraging decisions are behaviorally costly and have a large impact on individual fitness, they are less sensitive to the immediate consequences of a given choice and more sensitive to longer-term consequences than previously demonstrated.

Moss Sea Moss Sea is a coastal locality within the Gympie Regional Council local government area in the Darling Downs region of Queensland, Australia. The town of Gympie is about to the north-east. Geography Moss Sea is surrounded by high open country and the Mossy Creek, which rises from the eastern edge of the town, flows north-east then south-east to the Mary River and ultimately to the Pacific Ocean. History The locality is an undeveloped part of the Gympie Goldfield. Heritage listings Moss Sea has a number of heritage-listed sites, including: Moss Road: Moss Bay Cemetery

Recently, a clock control technique has been widely used in semiconductor chips in order to effectively carry out high-speed processing. The clock control technique is performed by adjusting the timing of a clock signal. The clock control technique includes

What's New In AutoCAD?

Create Your Own Path: There are many ways to get to your destination, but no one path that's right for everyone. Create your own path with the new dynamic way to create standard viewports (video: 4:07 min.)

Included in this release: Create your own path with the new dynamic way to create standard viewports

In this release you'll find new ways to do more with the dynamic viewports—a new appearance, new labels, new tools, and new, more versatile workflow. Do you want to quickly view more of your model from different angles? Explore the new dynamic viewports. Change viewports, axis orientation, and viewing direction, on the fly, with a few keystrokes. Use the new dynamic viewports to adjust your design space, quickly and easily. The new dynamic viewports are new to AutoCAD. They take the capabilities of the traditional viewports, and give you the ability to switch the viewing direction of any viewport, as well as, create multiple dynamic viewports. You can create a new dynamic viewport and switch between them, without ever leaving your drawing. You can change the viewports into any type of view. Set the view of a viewport to orthogonal, perpendicular, lateral, parallel, 2D, 3D, or 4D. You can create a new dynamic viewport and switch between them, without ever leaving your drawing. Just like the traditional viewports, the dynamic viewports support multiple viewports, views, and aspect ratios. It doesn't matter if you have 10 or 10,000 viewports. You can even toggle through them, without switching between traditional viewports. Just like the traditional viewports, the dynamic viewports support multiple viewports, views, and aspect ratios.
