AES (Advanced Encryption Standard) is one of the most secure algorithms currently available. It has been a core part of most standard encryption algorithms since the 90s and is found to be the de facto standard against the World's leading encryption algorithms. AES is a symmetric key algorithm that uses common key length of 128 bits, 192 bits and 256 bits. It takes a 128-bit key, with the key size varying depending on the value of the key. There are four different types of key sizes, namely 128, 192, 256 and 256 bits. There are many types of keys and their popular usage, the most important key that you have probably used is 128-bit key which is used commonly, as it is the most economical and efficient method. Now, it is time to know what this AES Algorithm actually does, AES is a symmetric algorithm which performs encryption by taking the block, in CBC mode and using the key in an extremely secure way to decrypt the data. AES Algorithm Key The key to decipher or encrypt data is the secret key. If you know the secret key, then you can easily decrypt or encrypt the data. However, in the age of computing, we cannot keep the secret key private. This is where a symmetric algorithm comes to play. The symmetric algorithm uses a common key
