Q: Can a simple function be a primitive function? The definition of primitivity of a function f is that it is not constructed using f , f' or f'' . Does this necessarily imply that f is not a primitive function? A: No. Take $f(x) = \frac{1}{x}$ and we have that $f'(x) = -\frac{1}{x^2}$ and $f''(x) = \frac{2}{x^3}$
$$f' + f'' = -\frac{1}{x^2} + \frac{2}{x^3} = -\frac{x + 2}{x^3}$$
 This is a primitive function, and a simple calculation shows that $\frac{1}{x}$ is a primitive function, so you cannot define primitivity in terms of $f' + f''$. A: What you are really asking is whether the notion of a primitive function f is equivalent to the notion of a function with $f' = f$. Yes. That is actually the definition of a primitive function. However, in your case you can also find a
