Sustainability In recent years, CAD technologies have been applied to the field of sustainable design. According to PVS Energy, CAD software "has always been perceived as an expensive tool" and since the CAD revolution in the early 1980s, only few CAD users have been interested in sustainable design. In 2010, CadSoft announced a partnership with the University of California, Berkeley. Together with PVS Energy and the U.S. Department of Energy, CadSoft and Berkeley will combine efforts to develop a software package for CAD and Geomatics. CadSoft hopes to leverage its existing Autodesk Suite for CAD and design collaboration and the Berkeley campus' "sustainability applications". Since 2012, the International Green Building Alliance (IGBA), has developed a CAD standard to demonstrate sustainability in the design, build and operation of buildings. The IGBA sustainable design program represents the most widely recognized code for sustainable design within the construction industry. The IGBA sustainable design standards require

specification of the carbon footprint of a building as part of the design documentation, thereby exposing a design's energy and resource use. CAD and simulation CAD software is widely used in industry, particularly in engineering and other industries requiring visual display of design models and calculations of complex shapes or other design details. Automation has allowed CAD programs to become fast, interactive, and able to provide tools to ease the design process. The use of CAD in industrial and automotive design is of growing importance. CAD software is used to model the internal components of large metal structures. CAD software can also create a 3D model of a house for use in a virtual environment. In this way, the virtual living space can be easily compared to a home built with the same design standards. What's New In?

Add to AutoCAD in new ways. Edit drawings in existing drawings, or upload existing drawings to AutoCAD. Then use the settings, parametric features, and Live Review to import, validate, and update parts of a drawing. Revise drawings even faster with Live Review, an interactive 3D model that allows you to instantly alter your drawing by editing it on the fly. (video: 1:33 min.) Expand your abilities even further. Simulate the dynamics of physical models in AutoCAD with tool paths and other advanced features. Live Review in AutoCAD Create more intuitive drawings with live review, the innovative and interactive 3D model that allows you to immediately change your drawings—right in the drawing. (video: 1:33 min.) With Live Review, you can:

- Add and edit geometric components
- Add 3D components
- Move, rotate, and scale parts
- Edit and modify existing components
- Edit geometry, object properties, color, linetype, hatch, layer, and lineweight
- See the interactions between your design and the physical world
- Turn a physical model into a dynamic, interactive, 3D design—ready to test and refine. Open your drawing and instantly access all the features of a physical model. Select any component, polyline, or point to start editing. Change the whole design from within a drawing. Add a new layer, change the colors, colors, colors, hatch, color, linetype, or lineweight of the component, or modify an existing property. See changes immediately reflected in your drawing. Create your own physical-model software. The ability to import 3D models from physical-model software is one of the most-requested features of AutoCAD. With Live Review, you can:
- Import from Avion, Blender, C4D, Fusion360, Google Sketchup, Meshmixer, Maya, Open3D, and others
- Create linked parts
- Scale, rotate, and move components
- Move components in three dimensions
- Rotate components in three dimensions
- Use existing components in Live Review. Modify the appearance of existing components. Change component properties, color, linetype, and lineweight
- Edit on the fly. View and modify
