The result is that you'll notice a dramatic difference in animation quality, with a more fluid and realistic player model. To experience the impact the new engine technology has on gameplay, just select the "Motion Capture" mode in Franchise and you'll be greeted by a version of the game that reflects this new engine, in conjunction with new player models, animations, ball physics and play mechanics. The "Motion Capture" mode is available in early access on PlayStation 4 via the in-game overlay menu. Stay tuned for more information on FIFA Ultimate Team and the new features available at launch. The present invention relates to a method for forming a silicon layer, and more particularly, to a method for forming a silicon layer, which is an electrode layer of a capacitor of a semiconductor device and which is used as a contact layer of an FET having an SOI (Silicon On Insulator) structure. The SOI structure is a new structure having a single crystal Si layer on an insulating layer. In comparison to the conventional semiconductor device, the SOI device has many merits such as a reduction in power consumption, high-speed operation, an increased degree of freedom in designing the driving power source and the like. In a conventional semiconductor device, on the other hand, the driving power source for driving the device is prepared in the semiconductor device, and therefore, a parasitic capacity of the driving power source cannot be controlled. In an SOI semiconductor device, on the other hand, the substrate is prepared in the device, and therefore, the parasitic capacity of the driving power source can be controlled, and also, there is no possibility of a short-circuit defect between a source and a drain and between a source and a gate. FIG. 1A is a cross sectional view of a conventional semiconductor device, while FIG. 1B is an equivalent circuit diagram of the semiconductor device shown in FIG. 1A. As shown in FIG. 1A, a conventional semiconductor device includes a semiconductor substrate 1 of a P-type conductivity, a silicon oxide layer 2 formed on the semiconductor substrate 1, and a P-type well 3 formed on the silicon oxide layer 2. As shown in FIG. 1B, the conventional semiconductor device includes a P-type well 3 formed on a silicon oxide layer 2, and an N-type impurity ion doped MOS transistor (insulated gate field effect transistor) 5 in
